Cay Anderson-Hanley, PhD | Union College
My research interests lie primarily in the realm of clinical neuropsychology and health psychology. In particular, I am interested in the neuropsychological effects of exercise for older adults, especially as it might relate to the maintenance of cognitive and emotional functioning, and the prevention of dementia. Recent studies completed in my lab indicate the executive function benefits of both strengthening exercise as well as virtual reality-enhanced exercise (cybercycling or pedaling & playing the iPad-based iPACES neuro-exergame) for older adults. Other recent research out of my lab has examined the effects of therapy groups for older adults, expressive writing for the emotional and physical well-being of dementia caregivers, and the benefits of exercise in schizophrenia and autism.

As a social psychologist, I have broad research interests that include marketing and advertising, persuasion, perceptions of fairness and unfairness, attitude measurement, and social norms.

Zachary Buchin
Bailey Hall Room 311C, 388-6804, buchinz@union.edu
My research on human memory is broadly focused on applying cognitive principles to educational practice. I am particularly interested in retrieval-based learning and the testing effect, in which retrieval practice (e.g., recall, flashcards, practice questions, etc.) benefits later memory to a greater degree than more typical study-based strategies (e.g., restudying, rereading, copying, etc.). Specifically, my research examines: (1) how these memory modifying effects of retrieval are affected by divided attention/distraction; (2) the generalizability of retrieval-based learning across educationally-relevant factors (e.g., task complexity and prior knowledge); and (3) the indirect effects of testing on learning (e.g., taking a practice test on A will enhance the benefits from later restudy of A as well as later initial study of new material B). I plan to examine these topics both in the lab as well as in the classroom (e.g., assessing the effectiveness of different evidence-based learning and study strategies).

Bailey Hall Room 311B, 388-6275, burnsd@union.edu
I study human memory. Recently, my students and I have studied 1) the relationship between memory confidence and repetitive checking behaviors, as seen in individuals with OCD (Do people check more because they have less confidence in their memories?), 2) the extent to which evolution has shaped or fine-tuned our memory systems to facilitate the remembering of some information more than others information, 3) the paradoxical finding that perseverating about dying improves memory functioning.

Bailey Hall Room 311A, 388-6542, debonok@union.edu
I am interested in the relations between personality factors and responsiveness to different kinds of persuasive messages. In particular, I study whether differences in self-monitoring tendencies are related to: the kinds of persuasive information to which people are responsive and how they process that information. I often study these questions in the context of advertising. I am also interested in investigating the role that religiosity plays in aspects of mental and physical health.

Lippman Hall 119, 388-6782, guerranm@union.edu
I am passionate about utilizing research as a tool to understand and address social problems, particularly those facing diverse LGBTQ+ populations such as immigrants, Latinx persons, and transgender and gender non-conforming individuals. More specifically, my research is focused on health equity and understanding factors which influence health-seeking behaviors and health outcomes. I am particularly interested in sexual health, diagnoses tied to sex assigned at birth (e.g. gynecological cancers, prostate cancer), inclusive sexual education and health promotion, and factors such as self-efficacy, sense of community, communication, and prior experiences in healthcare settings. As a community psychologist by training, I often utilize community-based and participatory methods in my work.

I have three overlapping areas of research interests: (1) The effects of psychological security and insecurity. Humans are fundamentally motivated to feel secure, which affects us in many ways. I and my students have studied the effects of security and insecurity on close relationships, self-esteem (e.g., academic, athletic, and appearance goals), attitudes (e.g., belief in evolution and intelligent design; support for military interventions and political candidates, belief in conspiracy theories), risk-taking, information-processing, and decision-making. (2) Attachment and close relationships. I am interested in how security-related individual differences (especially attachment style) influence close relationship and non-relationship phenomena. (3) Self-esteem and belief systems. I am also interested in the ways that people enhance and maintain their self-esteem and beliefs about the world. Therefore, research on self-esteem or worldviews (e.g., politics, religion, morality) is generally in my wheelhouse.

The overarching goal of my research is to identify the psychological factors that lead people to behave in antisocial ways. Recently, I have examined the associations of antagonistic personality traits (e.g., narcissism; psychopathy) with conspiracy beliefs, homonegativity, and gaslighting. To examine the correlates of these behaviors, however, it is necessary to have scales that are psychometrically sound and data that is sufficiently free of error. As such, a second focus of my research involves developing and validating new scales, while a third focus of my research involves designing tools for improving data quality.

Chad S. Rogers, Ph.D.
Much of my prior work has been focused on speech comprehension in young and older adults. My approach represents a combination of cognitive psychology, neuroscience, linguistics, and audiology. My specific research topics of late are: (1) The neural reorganization of speech processing. I am interested in how young and older adults may engage different routes to successful speech processing by recruiting different neural mechanisms revealed through EEG, structural and functional MRI. (2) Effortful listening and its impact on semantic processing. In difficult listening situations people report expending cognitive effort to achieve successful speech comprehension. I am interested in how people use meaning and semantics as a “shortcut” to reduce effort. (3) Linguistic and acoustic contributions to auditory memory. I am also interested in how variables like syntax and background noise make information not only difficult to understand, but also less likely to be remembered.

Stephen Romero
Butterfield Hall Room 308, 388-7106, romeros@union.edu
Current research pursues three general goals: (1) Investigating neuronal plasticity associated with acquisition of new cognitive skills, recovery of function after brain injury, and associated with neurological and psychological disorders. These studies include the use of behavioral, neuroimaging and EEG methods with patients and unimpaired volunteers; (2) Investigating the role of optimism in cognitive skill learning through the use of behavioral, EEG, and Neuroimaging methods with patients and unimpaired volunteers; (3) Investigating neurological basis of musical processing through the use of behavioral, EEG, and Neuroimaging methods with patients and unimpaired volunteers.

Bailey Hall Room 301D, 388-6538, walkerc@union.edu

My research focuses on body image, eating disorders, and disordered weight- and shape-control behaviors. Specifically, individuals with body dissatisfaction repeatedly engage in body checking or body image avoidance behaviors, to gain or avoid information about their shape, weight, and size. My research has examined how body checking and avoidance behaviors impact body image and weight-and shape-control behaviors. I also have a research interest in body image and disordered eating and exercise behaviors in men. Lastly, my research focuses on clinical applications of prevention and treatment for eating disorders and body image dissatisfaction.

Carol Weisse  
Olin 110C, 388-6300, weissec@union.edu

My research examines the dying process from both patient and caregiver perspectives. I am particularly interested in a model of care where patients with home insecurity and/or caregiver instability receive care by non-familial caregivers in community-run residential care homes. My research team has been studying the management of symptoms such as pain, anxiety, and restlessness and how caregivers dispense hospice-prescribed medications. I am also investigating creative ways of using narratives about dying (e.g. through theater, public art, film etc..) to improve death literacy.
